400 GeV pp Run Issue 20 Apr 05

Summary of discussion to date (Y. Makdisi)

- **Machine issues**
  - **3 days to setup ramps**
  - **3+ days to establish adequate polarization**
  - **Can start mid-May, before PAC meeting (3rd week of May) or after the PAC meeting**
  - **Prefer 1.5 day PHOBOS physics at end of 200 GeV pp run**

- **Experiments issues**
  - **PHOBOS – strong advocate for short physics run, above schedule OK**
  - **STAR – decide after pp physics is established, priority is to integrate 4-6 pb^{-1} of delivered luminosity (P>35%) at expense of 400 GeV development run if necessary**
  - **PHENIX – priority is to integrate 1.5 pb^{-1} of recorded luminosity (P>45%) before development run and push 1 day PHOBOS physics run to end of 200 GeV pp run**
  - **BRAHMS – does not plan to run**

- **Status:**
  - **Decision will be made at a later date**

Corrected after meeting

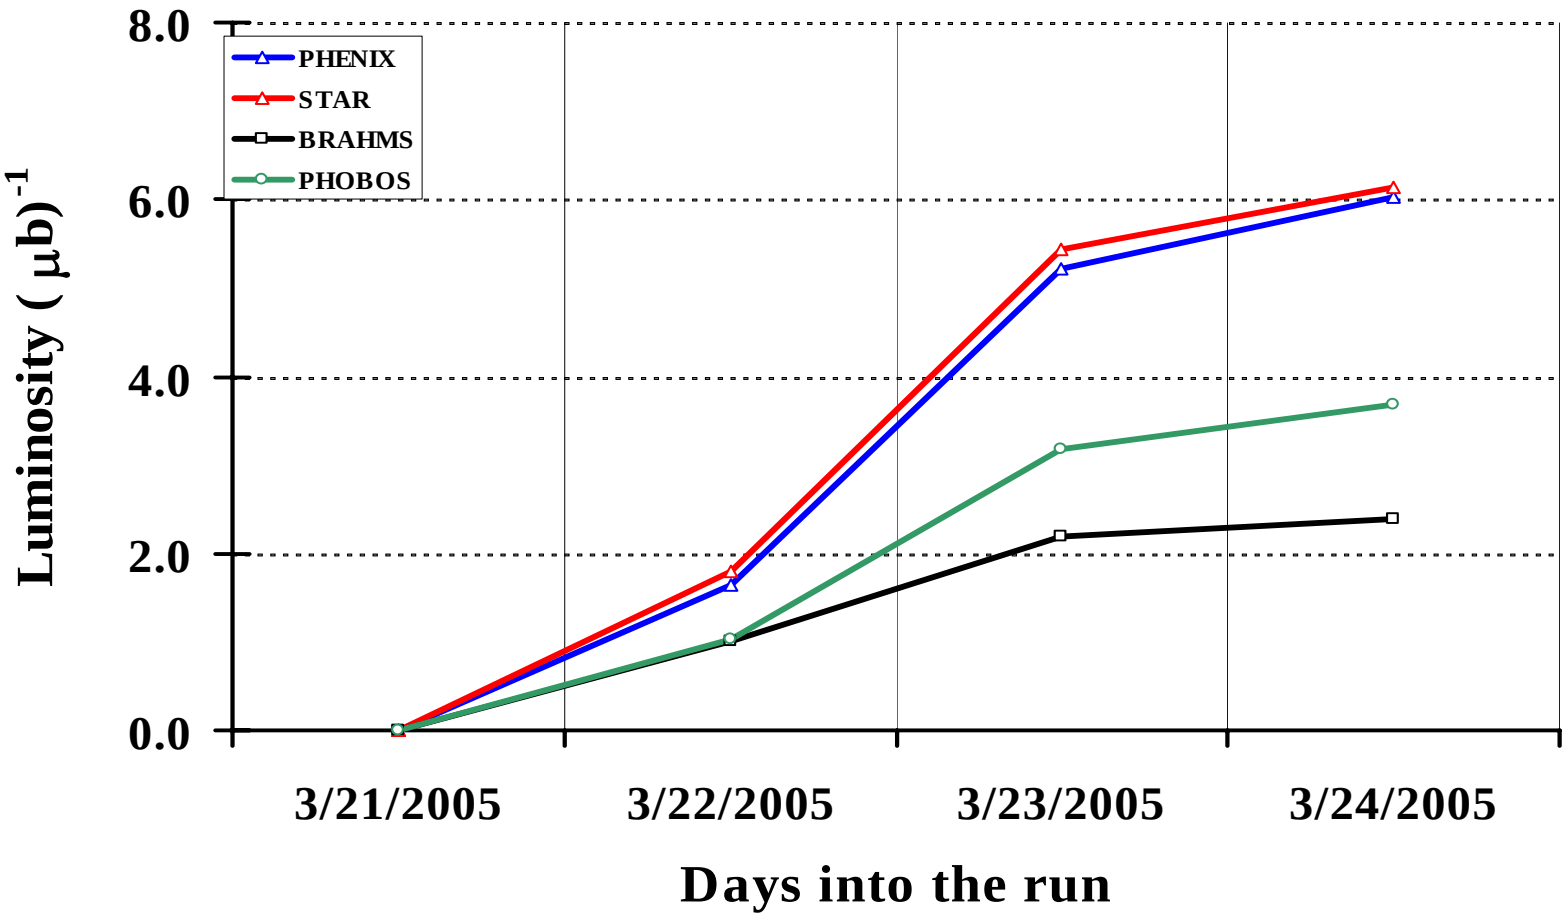
RHIC Machine/Detector Planning Meeting

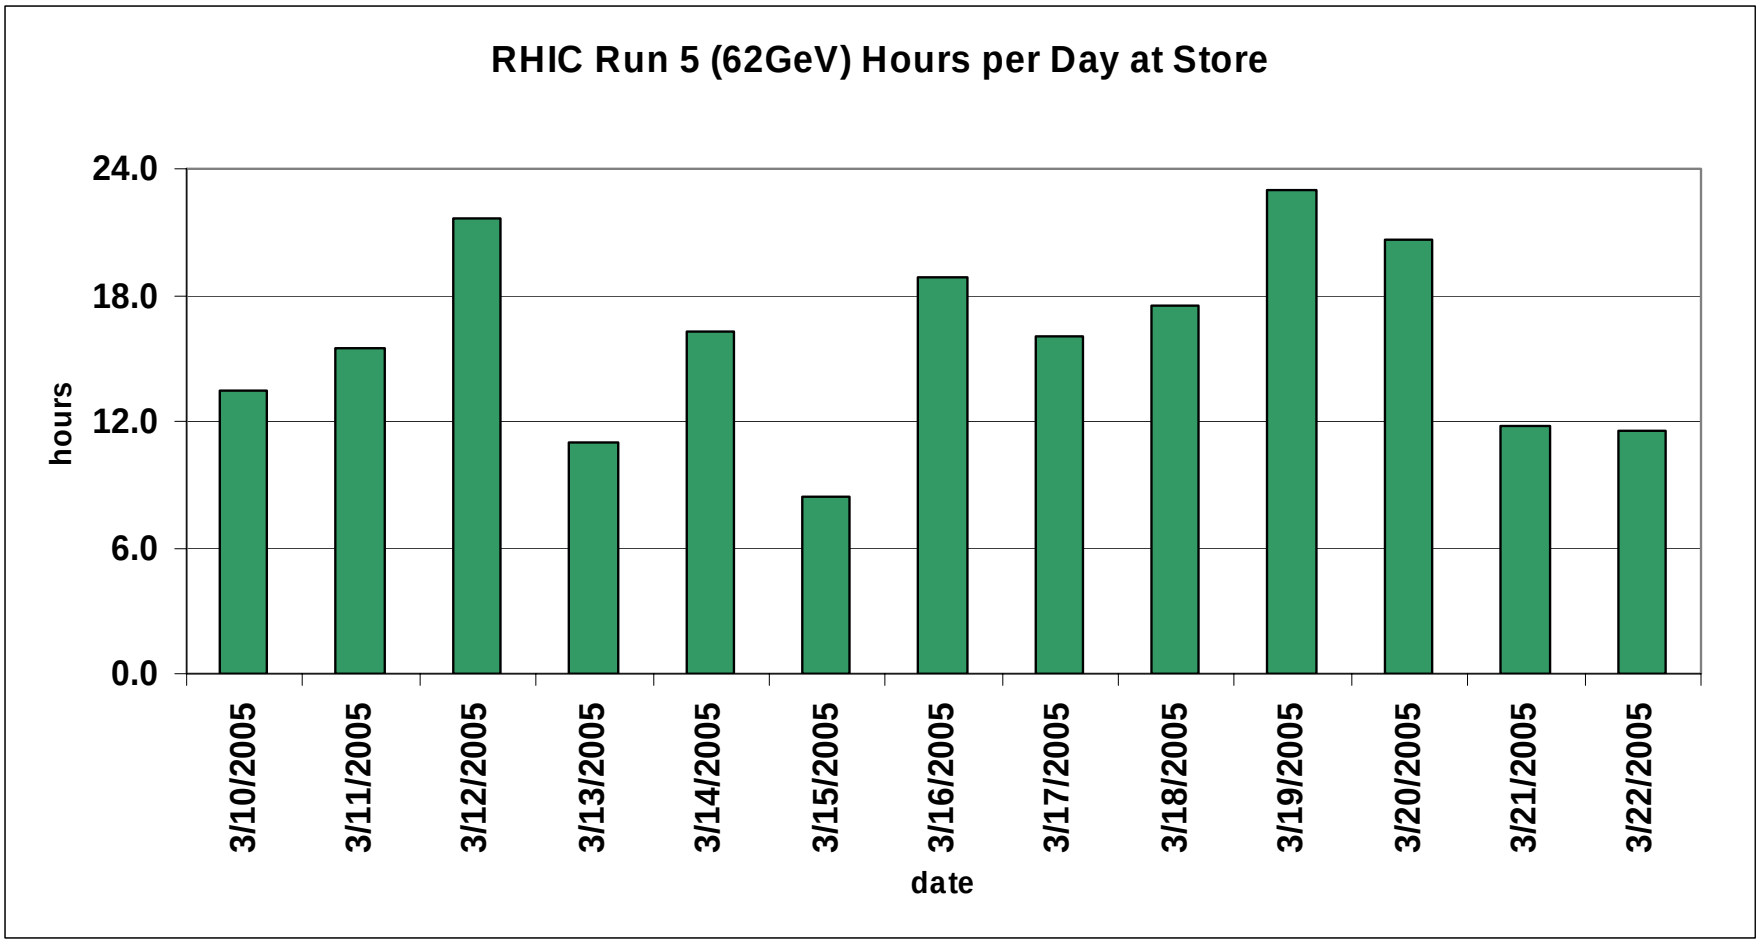
17 November 2004

PAC Recommendations (very short summary):

- 8-10 week pp run should have highest priority
- Cu-Cu run should accumulate an integrated delivered luminosity of at least 7 nb^{-1} at $\sqrt{s}$ = 200 GeV
- Cu-Cu at $\sqrt{s}$ = 62.4 GeV and 1 day at injection is advisable if above goals are met
- 1-2 day pp (unpolarized) run at $\sqrt{s}$ = 400-500 GeV desirable

RHIC Run 5 (22 GeV) Final Delivered Cu-Cu Luminosity





Total = 205.5 hours
0130 10 Mar – 1330 22 Mar = 300 clock hours
68.5% or 115 hrs/week average
