

STAR Run 10 - Au+Au 62 GeV Status: As of 8am March 30

- STAR met the goal of 100M mb evts
 - STAR operation has been very well
 - RHIC beam extremely good:
 - short time between stores,
 - beam background very good.

- Started taking central trigger data (collect $\sim 20M$ within 4 days), and scaled down the min_bias trigger rate.
- Want to change to 39 GeV the coming Monday morning; preparing to take PMD+FTPC data at the end of 62 GeV run and the beginning of 39 GeV run.
