Time Meeting

Status

- Due to radiation concern, we stopped vertical scraping in the Booster on Friday. After a meeting with safety people, we changed the beam loss location from E7 to B7 and the energy from 850MeV to near injection. This has been in effect since last night.
- We have seen lower polarization (low 60%) over the weekend. The source polarization seems lower than before by a couple percent. AGS polarization got worse (below 60%) yesterday. A new jump quad timing is derived last night. Currently, we are checking AGS to find out what have drifted away.
